PRESENTER

**DR. PHIL LESSNER**

Ph.D in Chemical Engineering

33 years in Electronics Industry

25 years at KEMET

KEMET's Chief Technology Officer

Product, Material, and Process Development

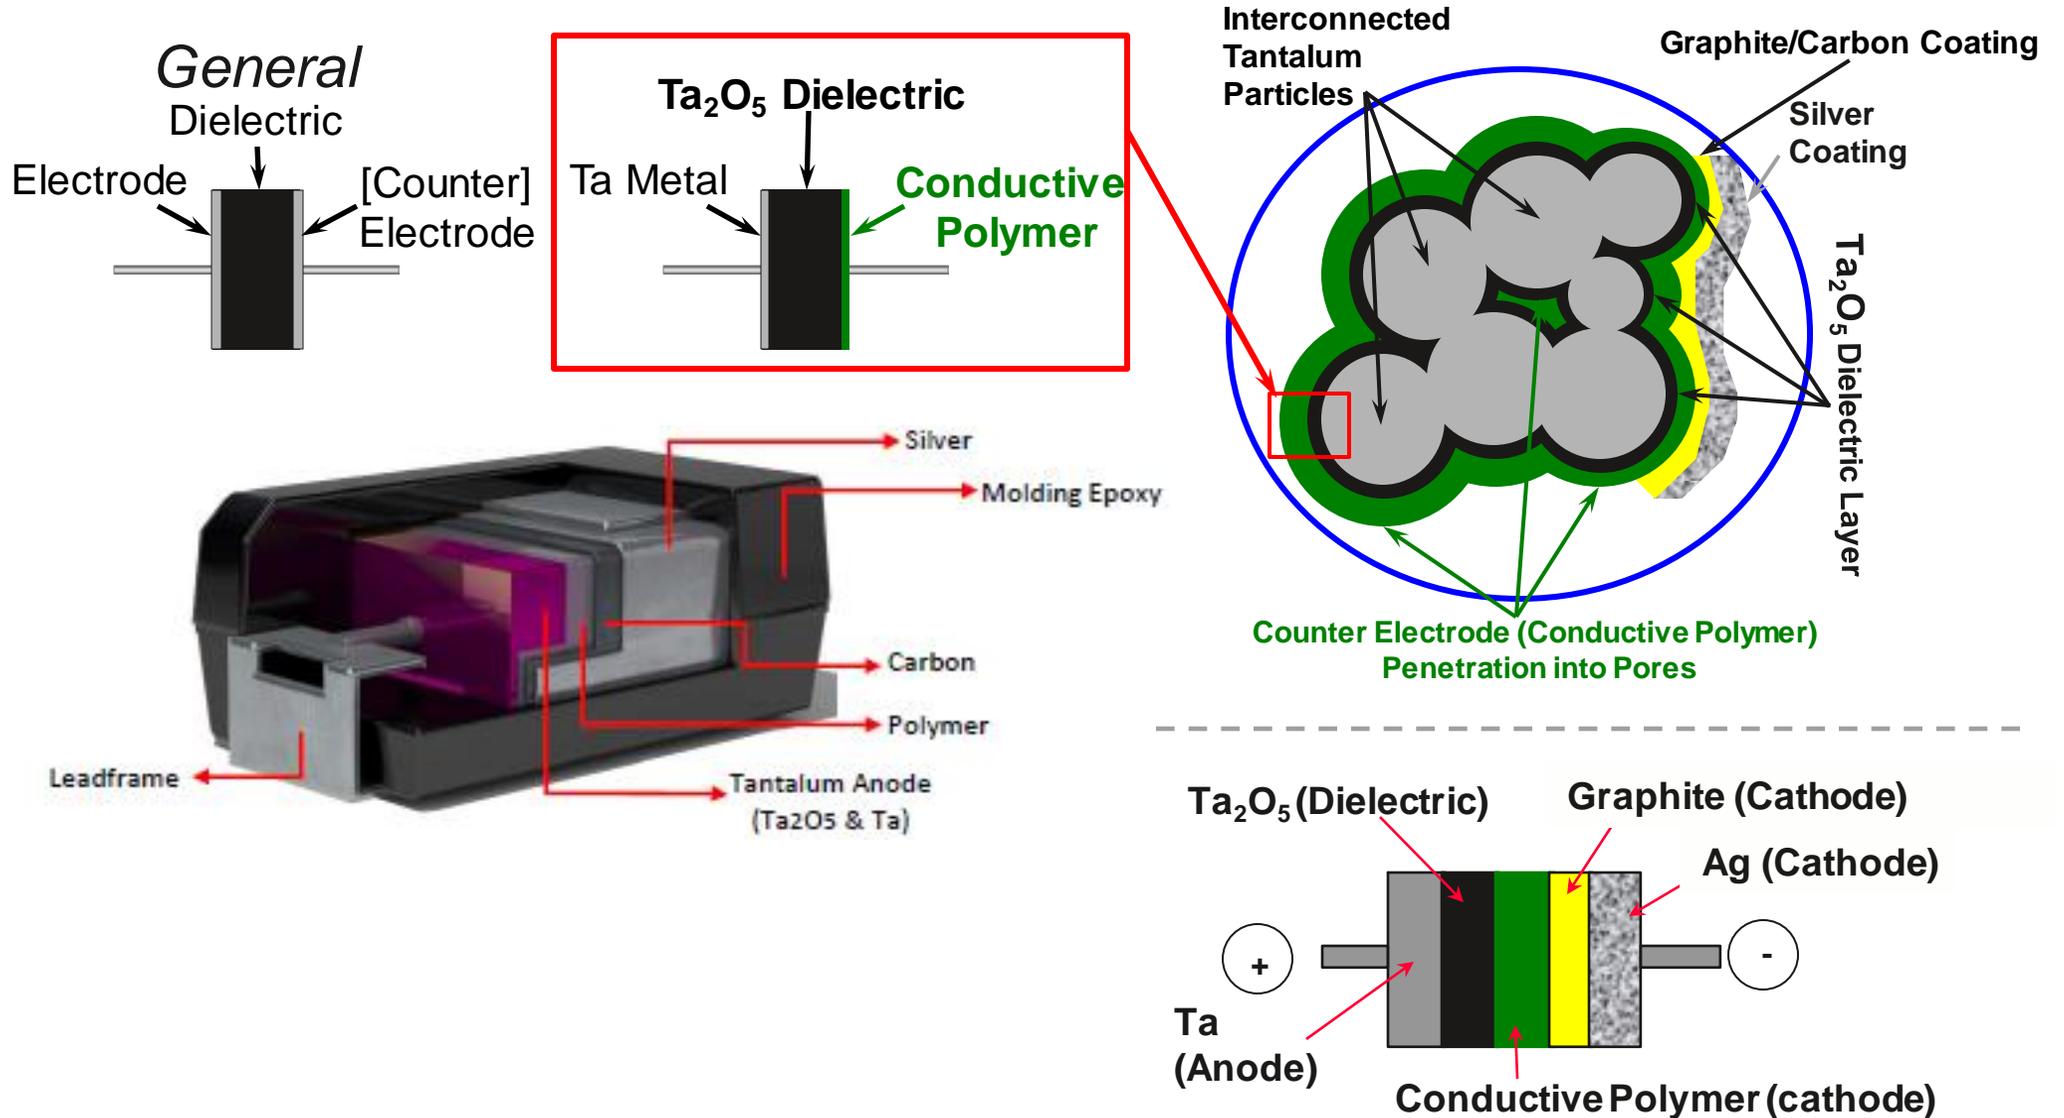

# Outline

---

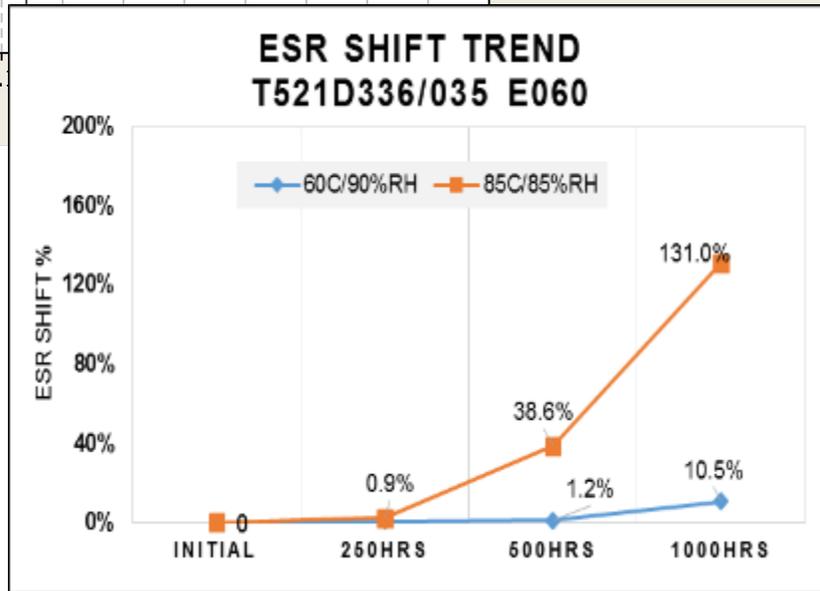

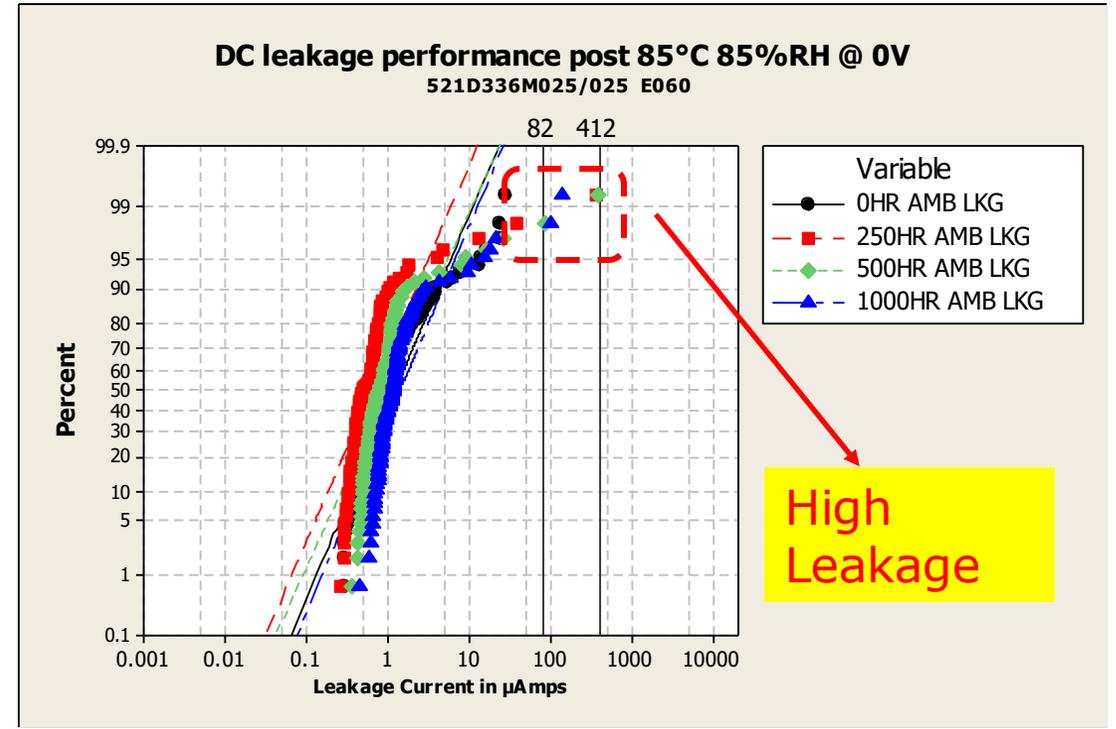

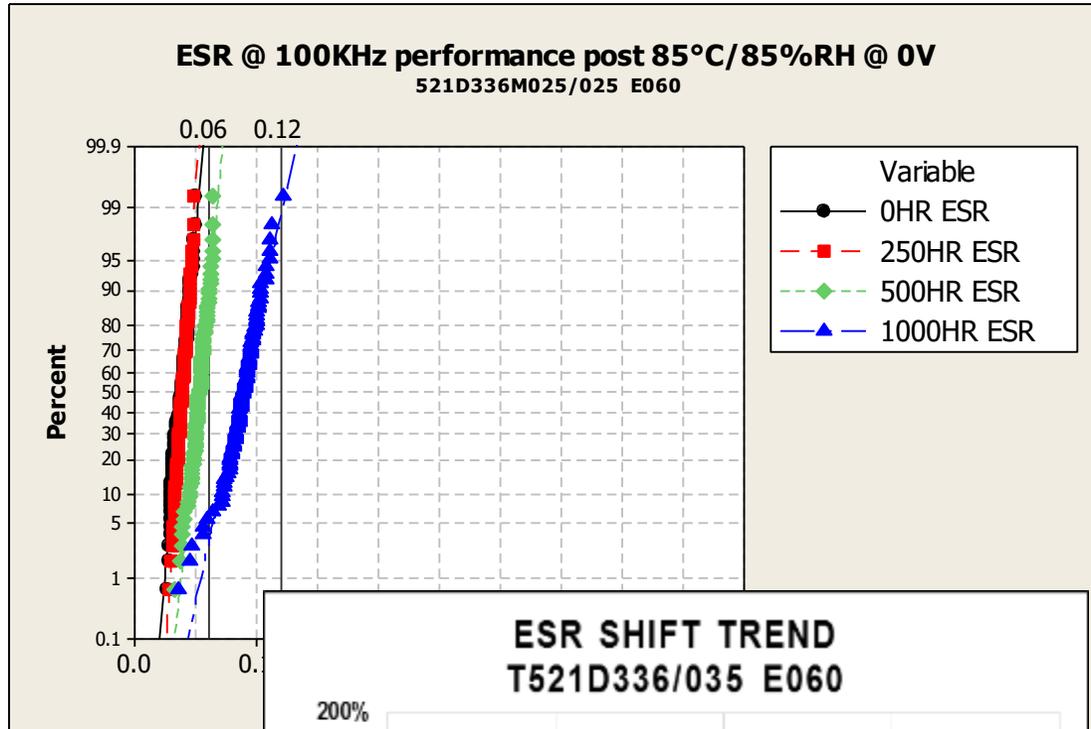

- Tantalum-Polymer Capacitors
- Aluminum-Polymer Capacitors
- Supercapacitors
- Film Capacitors

# Tantalum-Polymer Capacitor Construction

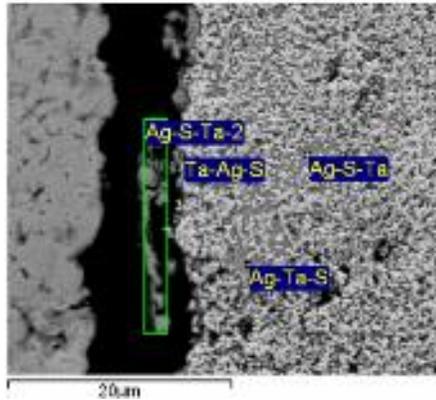

# Tantalum Capacitor Behavior Under Temperature/Humidity

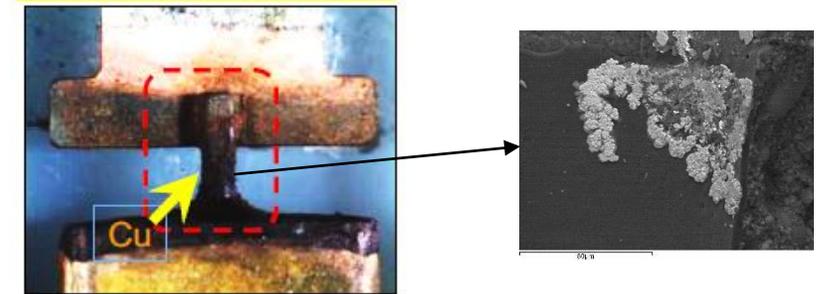

# Leakage Increase in Tantalum-Polymer Capacitors Due to Humidity

## Cathode

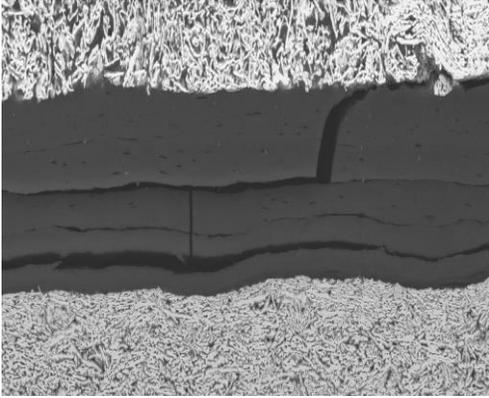

1. H<sub>2</sub>O gets into the parts via moisture sorption.
2. Corrosion of silver metal by the acidic solution of Fe<sup>3+</sup>, p-TS<sup>-</sup>, O<sub>2</sub>, etc.
3. Transportation of Ag<sup>+</sup> towards conductive polymer via diffusion.
4. Reduction of Ag<sup>+</sup> to Ag by conductive polymer
5. Silver in direct contact with dielectric causes increase in parametric leakage and/or failure.

## Anode

1. Cu-containing lead frame corrodes in presence of electrolyte and bias and forms Cu ions
2. Cu ions migrate to cathode.
3. Cu ions are reduced at cathode to Cu metal
4. Cu dendrites grow
5. Dendrites grow making a conductive bridge between anode and cathode.

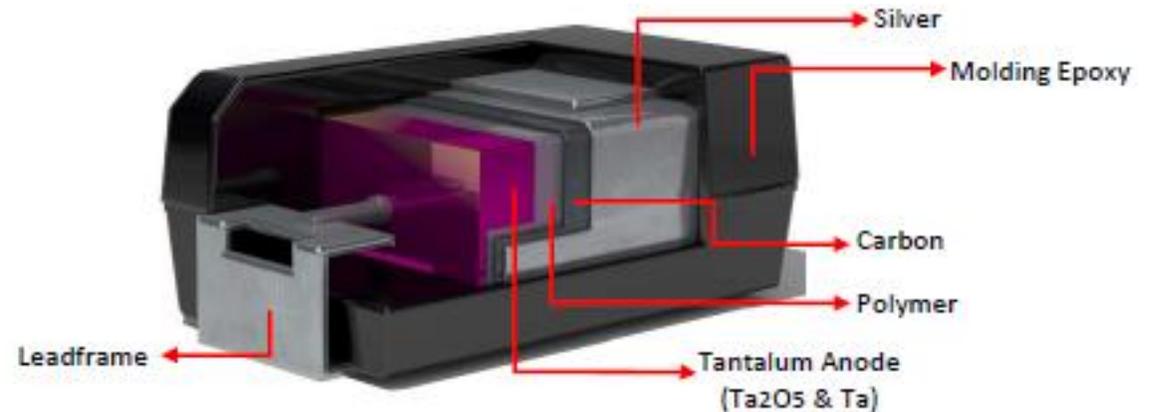

# ESR Increase of Tantalum-Polymer Capacitors Due to Humidity

- Poor adhesion of polymer
- Thermomechanical Stress on polymer from adjacent cathode curing/process, Assembly, molding
- Reflow stress (CTE mismatch)
- Poor adhesion of LF/Mold Epoxy interface
- Higher moisture sorption mold epoxy
- Moisture ingress stress (CME mismatch)
- Higher moisture sorption of polymer and swelling
- Bias causing stress increases delamination
- Bias across delaminated interface cause dedoping

# Solutions to Tantalum-Polymer Humidity Degradation

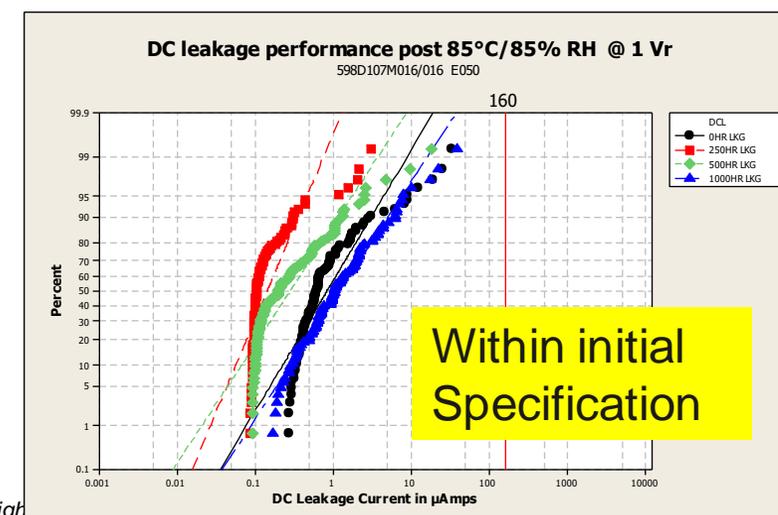

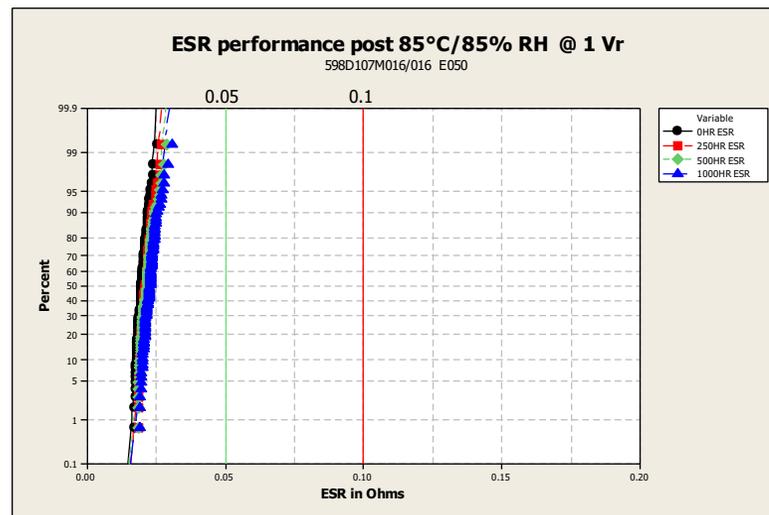

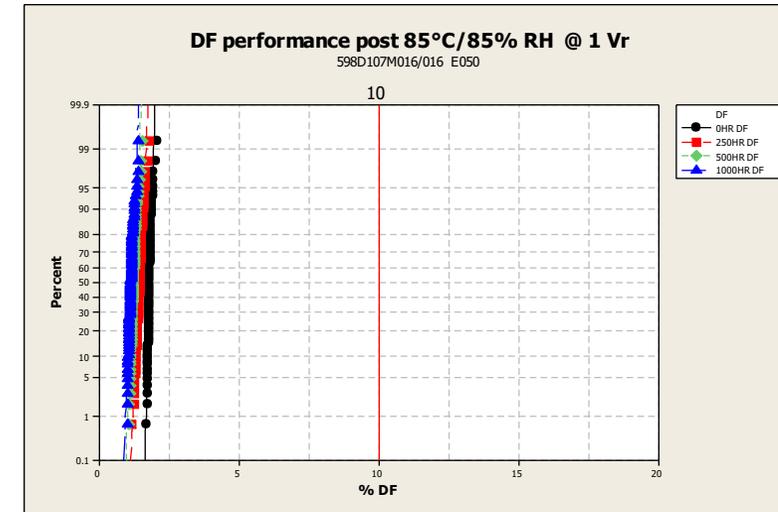

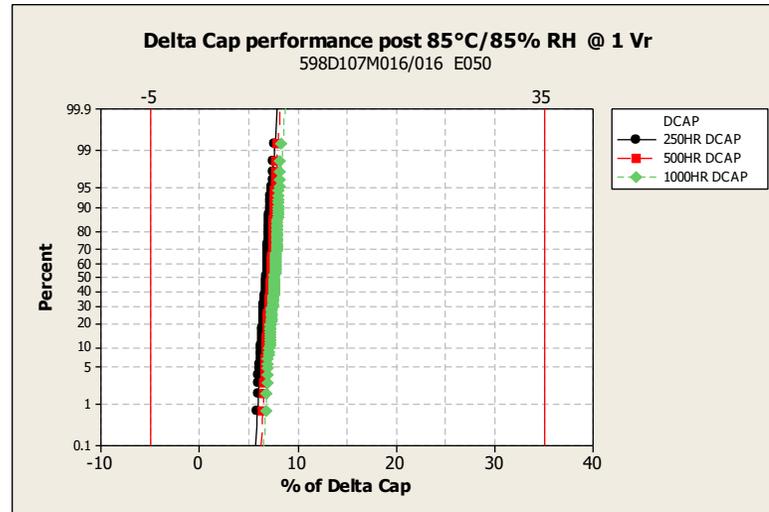

- Reduce moisture penetration through epoxy case
- Protective coatings
- Improve interfacial adhesion
- Low stress curing
- Low/non-Copper lead frames
- Reduction of ionic contaminants

# Putting It All Together

85°C/85% RH at Vr

Example of EIA7343-28 100uF 16V ESR = 50 mΩ

All Right

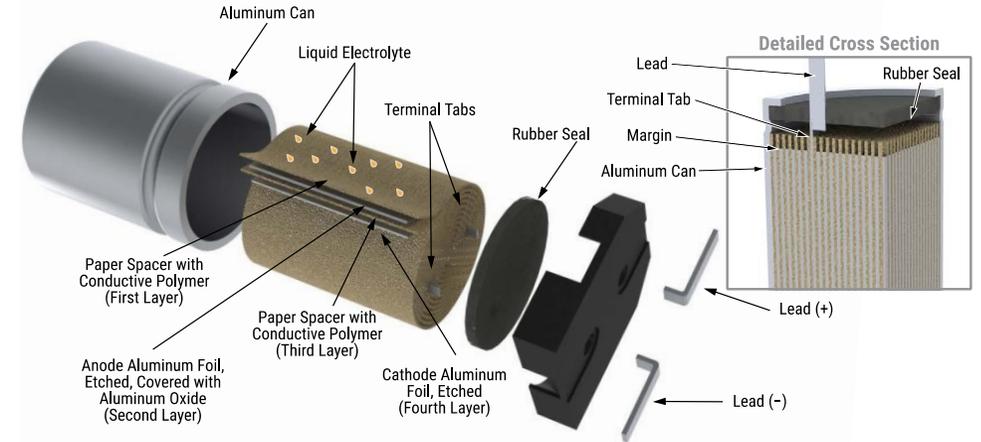

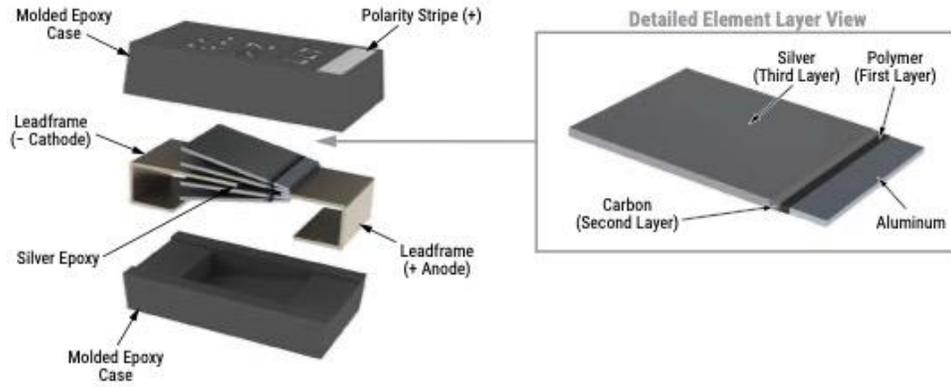

# Tantalum-Polymer Capacitors for Harsh Environments

Series	EIA Case Sizes	Voltage Range (V)	Cap Range ( $\mu$ F)	Lowest ESR (m $\Omega$ )	Temperature Rating ( $^{\circ}$ C)	85 $^{\circ}$ C/85%RH Endurance (h)	AEC-Q200
T591	3528-21 7343-20 7343-31 7343-43	2.5-75	1.5-680	6	105 or 125 2000h	500	No
T597 (Face Down)	2012-10 3216-12	2.5-10	22-100	9	125 1000h	1000	Yes
T598	3528-21 7343-20 7343-31 7343-43	2.5-75	1.5-680	100	125 2000h	1000	Yes
T599	3528-21 7343-20 7343-31 7343-43	2.5-50	10-150	25	150 2000h	1000	Yes

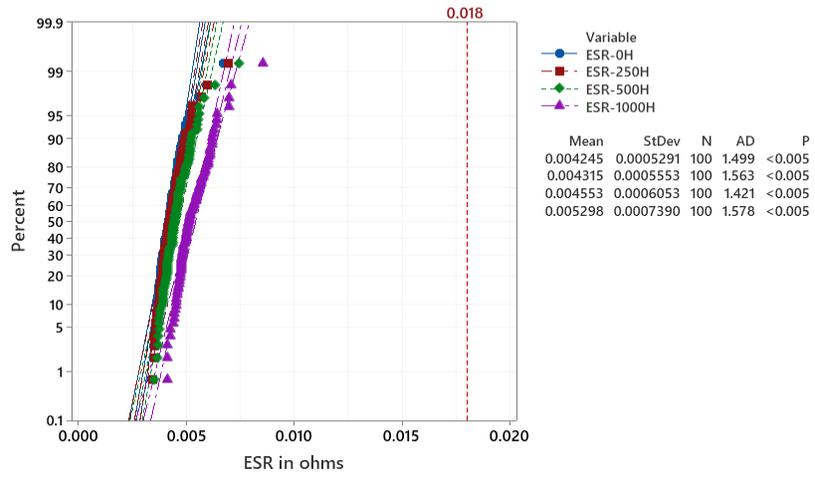

# Aluminum-Polymer Construction and Performance

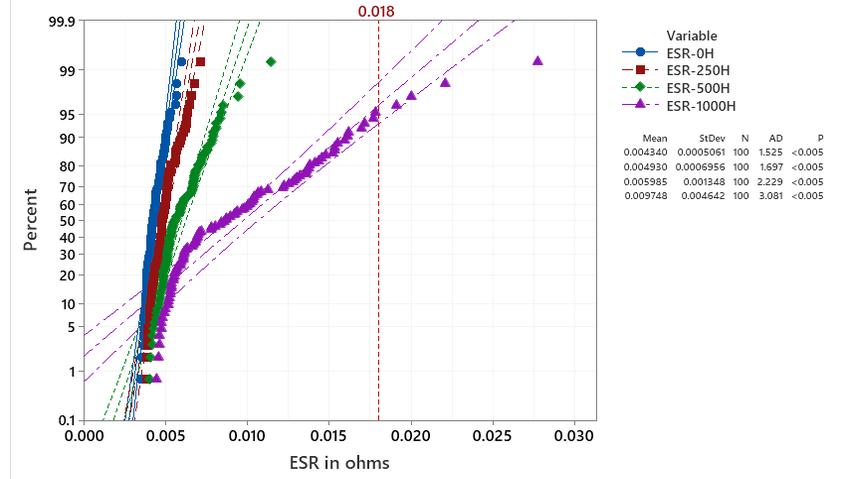

A700 60°C/90% 1000Hrs ESR

A700 85°C/85% 1000Hrs ESR

60C90% Load  
Normal - 95% CI

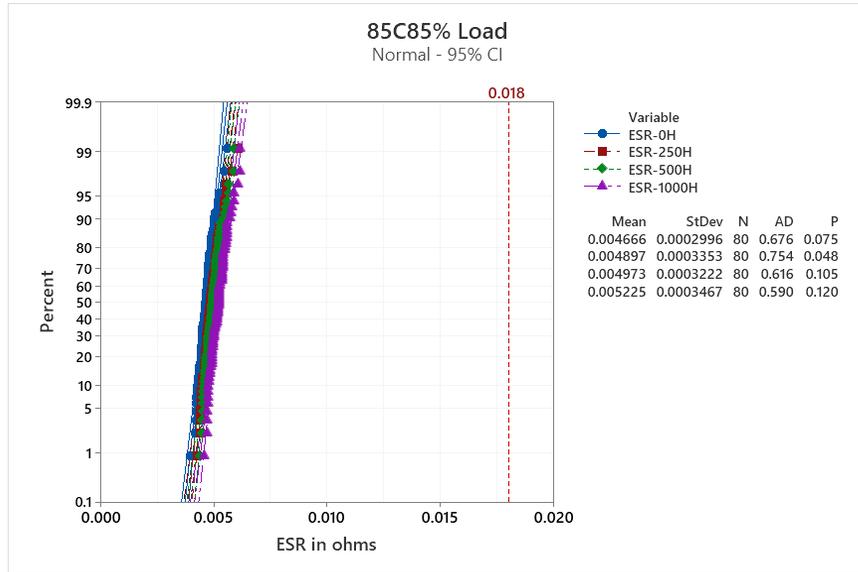

85C85% Load  
Normal - 95% CI

# Aluminum-Polymer Capacitors for Harsh Environments

## A798 85°C/85% 1000Hrs ESR

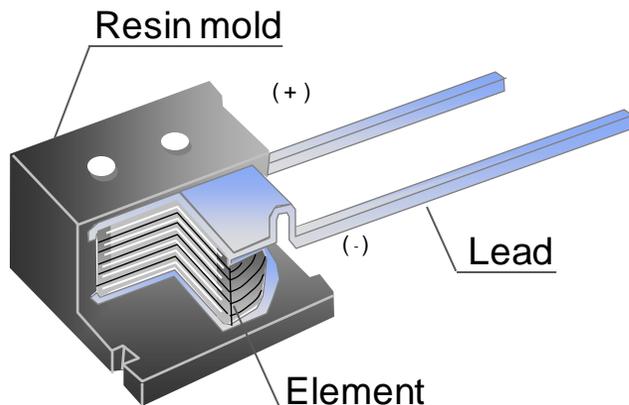

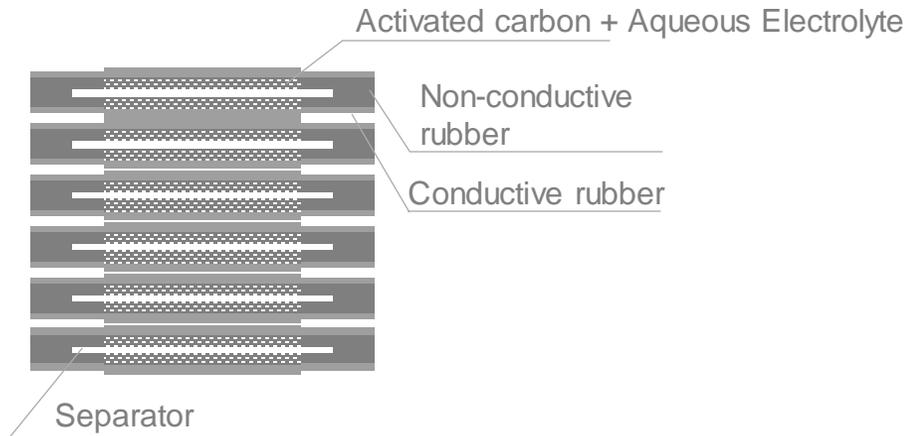

Series	Type	Voltage Range (V)	Cap Range (µF)	Lowest ESR (mΩ)	Temperature Rating (°C)	Humidity Endurance	AEC-Q200
A768	V-Chip Polymer	16-80	18-1000	17	125 2000h	60°C/95%RH 1000h	Yes
A780	V-Chip Hybrid	25-63	56-680	20	125 4000h	85°C/85%RH 2500h	Yes
A798	H-Chip Polymer	2-2.5	470	9	125 1000h	85°C/85%RH 1000h	No

# Supercapacitors for Harsh Environments

85°C, 85°C/85%RH 1000h

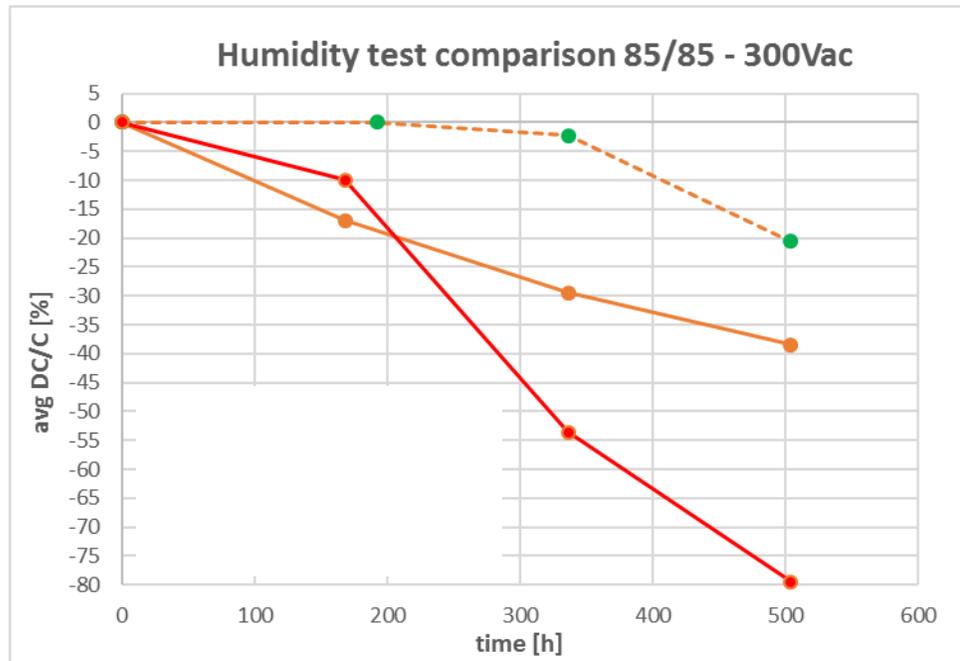

Part Number	Voltage (Vdc)	Capacitance (F)	ESR ( $\Omega$ @ 1kHz)	Lkg Current (mA @ 30min)
FU0H105ZF 	5.5	1.0	10	1.5
FMD0H334ZF 	5.5	0.33	25	0.5

# Film Capacitors For Harsh Environments

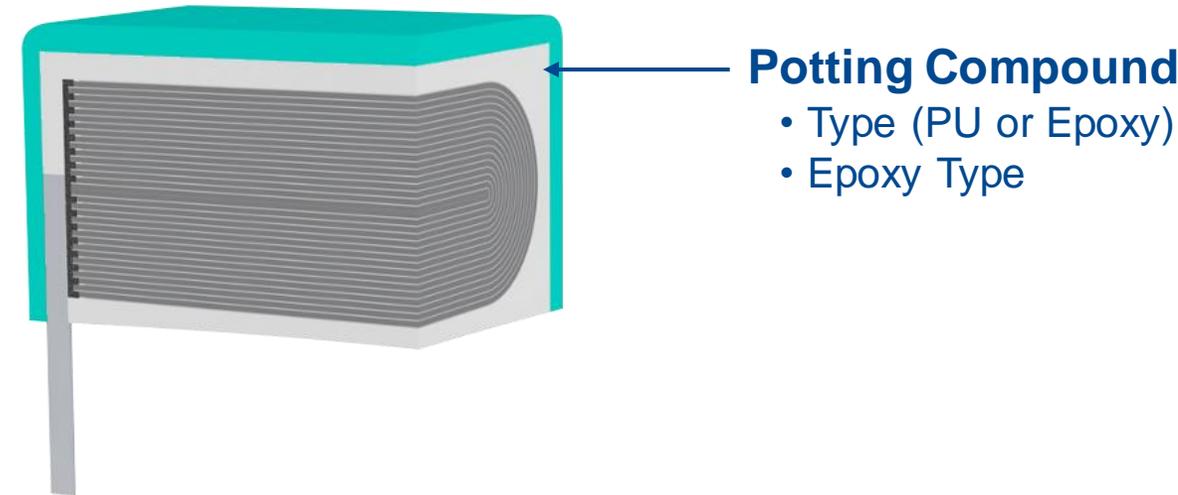

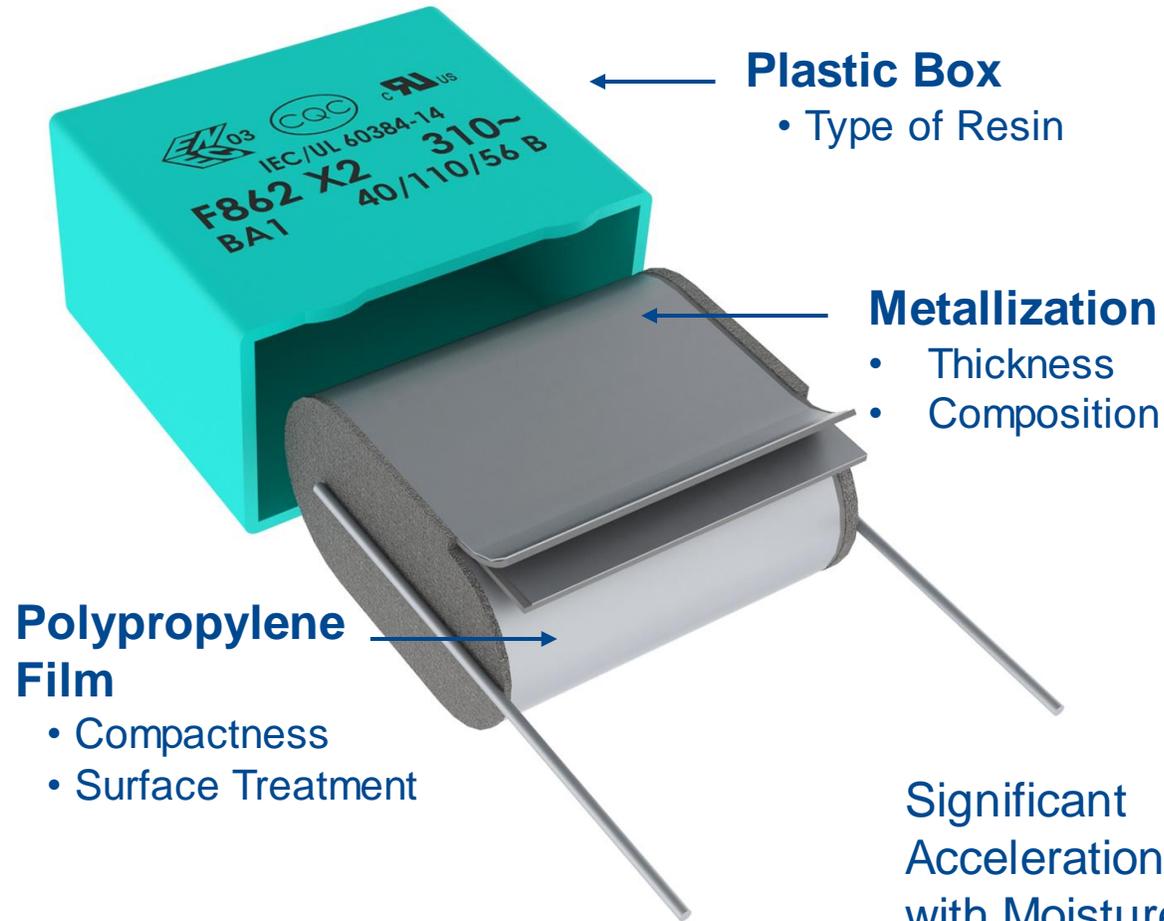

## Film X2 Suppressor Capacitor Baseline—No Humidity Protection

Film capacitors show a degradation of capacitance with humidity exposure.

# Film Capacitors for Harsh Environments

## Capacitance Degradation Mechanisms

Significant Acceleration with Moisture

- Chemical Corrosion of Metallization
- Electrochemical Corrosion of Metallization
- Corona Effect

# What is THB?

## Temperature Humidity Bias (Rated Voltage)

Grade	Test Condition A	Test Condition B
I	40°C/93%RH 21 days	85°C/85%RH 168 hours
II	40°C/93%RH 56 days	85°C/85%RH 500 hours
III	60°C/93%RH 56 days	85°C/85%RH 1000 hours

### Requirements

Capacitance	$ \Delta C  \leq 10\%$ 0.024 for $C \leq 1\mu\text{F}$
DF	0.015 for $C > 1\mu\text{F}$
IR	>50% of applicable limits
